

Report EDPs HCV

for the meeting in 07/22/21

Differential Evolution for all pacientes - long term results

Matheus Avila Moreira de Paula

UFJF

Differential Evolution (DE)

- Performed using up to 54 days of experimental data (Figures on the left)
- Average execution time of each simulation: 17000 seg = 4,72 horas
- maxiter = 30, popsize = 30

Comments

- The prediction is shown together with all the experimental values (Figure on the Right).
- We believe we can justify the failures to represent after 30 days due to having very small or non detectable values.

Table: Parameters - patients (B arm)

Pat	ϵ_r	ϵ_α	ϵ_S	α	r	δ	μ_C	ρ	θ	σ	c	error
